

AI-Supported Workshop Design: Quick Guide

The guide below is designed as a conceptual framework to begin constructing student-facing activities that leverage AI. These activities could range from analysis of idealized/simulated data sets, AI chatbots that simulate patient experience, or web-based simulations on complex topics, just to name a few salient examples. The goal of the framework is to provide you with a prompt that can be used by generative AI platforms to generate novel assignments for your course.

In this portion of the mini-symposium on Generative AI in Neuroscience Teaching, work through Steps 1-4 of this guide to redesign the learning experience while preserving the original learning objectives. NOTE: Some of these questions have already been answered.
